Bavaria Corporation International introduces GOL

A Natural Alternative to Antibiotics for Swine, Ruminants and Poultry

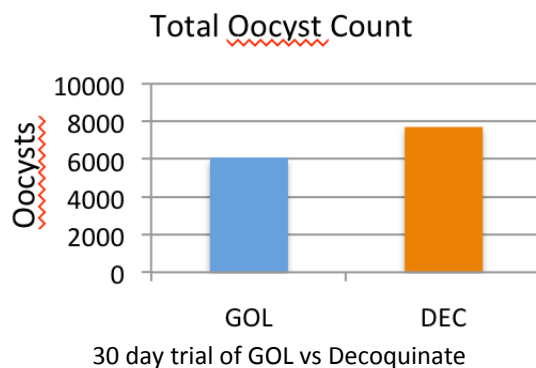

The danger of overuse of antibiotics to promote growth in livestock has become a major concern to farmers, scientists and the general public. One solution is found in nature. Organosulphured compounds in plants in the Allium family, such as garlic, have natural antimicrobial activity that provides benefits comparable to antibiotics without the risk they pose.

Bavaria's new product GOL, is a standardized pool of these organosulphured molecules. Added to an animal's feed or water, GOL improves intestinal health, helps maintain feed consumption and reduces diarrhea during infectious events. GOL also aids in controlling Coccidiosis and significantly increases transference of immunoglobulin G from parent to offspring thus maintaining overall health, increasing weight gain and lowering veterinary expenses.

Effectiveness of GOL against
Salmonella in Laying Hen

GOL helps to control Coccidiosis
Effectiveness in Ruminants
