

## **Combi Pullet promotes optimal development for your cage free pullet from day one!**

Farmer Automatic Combi Pullet was designed to fit the needs of both the pullets and the producer. Its unique design helps achieve the best results in cage free rearing, but can also be used for rearing pullets for enriched colony systems. The unique design of the Combi Pullet utilizes both vertical and horizontal movement throughout the house to optimize bird training. This makes the most of limited space, especially in existing buildings. Special features include swinging perches, making it easier for pullets to access the upper tier and helps prepare and train them for life in the layer system. These perches can be pushed toward the system and locked in place for easy access to vaccinate and monitor the birds. Hinged closing panels with swing design can be opened and closed when necessary. Adjustable water and feed for easy access for your growing bird. Two sizes of perch diameters reduces stress on the pullets as they grow preparing them for the layer system. Interior platforms provides maximum living space. Our system promotes optimum physical development for cage free pullets from day one and prepares them for a healthier more productive life as a cage free layer.
