ECODRUM COMPOSTER TO ATTEND IPPE 2017

Visit us at our booth: C3363 in Hall C

November 23, 2016 – The Ecodrum™ in-vessel composter came into existence around 2007 after a year of R&D into economical methods of disposing of barn mortality. Our team realized that the current options of disposing of animal mortality were labor intensive, with bio-security and maintenance problems.

Instead, we wanted the Ecodrum™ to be a long-term solution that is:

- Practical
- Cost effective
- Bio-secure

As part of our commitment to continuous improvement, we have worked with suppliers, designers and educators to develop our design and our knowledge in the field. We have technical research projects with four universities to study mortality composting, and have worked with countless NRCS state and local offices, Departments of Agriculture and State Veterinarians. We are the most recognized name in the In-vessel composting industry, and have built a reputation for providing reliable product with support from a qualified dealer network.

We are committed to continue raising the bar of excellence, knowing that we can make a difference in the world around us.
