## The Natural Solution for Sanitizing Commercial Poultry Confinement Areas

**LaCrosse, KS**—Growers everywhere know the importance of Food Safety and maintaining or increasing the livability of their broilers. It is critical to eliminate pathogens and ammonia to accomplish this goal. With Avian Influenza a priority the Poultry House Sanitizer uses heat with temperatures of 1,400° to eliminate all concerns.

**Flame Engineering** has a natural solution for the grower. The **Red Dragon Poultry House Flame Sanitizer** is designed to flame bare floors and litter. The flamer utilizes six LT 2x8 Liquid Propane torches that project intense, sweeping flames under a sturdy enclosed hood. The unit produces heat over 2000°F and maintains approximately 1400°F which kills pathogens and flares off ammonia vapors.

The **Red Dragon Poultry House Flame Sanitizer** is safe and easy to operate with complete control from the tractor seat. It offers immediate results and is less expensive than chemicals. Growers have experienced lower mortality and increased bird weight which increases individual settlements. It is environmentally sound since there is no runoff, residues, or water contamination. It is powered by clean, efficient and affordable propane.

The **Red Dragon Poultry House Flame Sanitizer** is great for Organic and conventional growers and proudly made in the U.S.A.
