PRESS RELEASE

Kohshin Engineering is a Japanese Company Located in Nagoya Japan. We produce Composting machines for animal waste management. For more than a decade we have been exporting our composter to Asia, Middle East, Europe and South America, and as of now we have reached 29 countries.

We have been exporting various models with single pit and double pit type composters that can process from 4 tons to 60 tons of animal waste per day.

Now, we would like to introduce our 2 “NEW” type of Composters: **Convertible Type Composter** and **Open Rotary Type Composter**.

Convertible Type Composter is a single-pit type composter which can be converted into 2 pits type Composter by adding extra accessories. This type of Composter is highly recommended for farms that are planning to increase their production in the next few years. Since the capacity of the machine can be doubled by just converting it into a double type composter, it would not be necessary to buy another single unit composter even after expanding your production.

Open Rotary Type Composter is a type of composter that is designed with one sided rail only, the material can be placed from any side of the machine. It is a flexible type Composter as you may place and take out the material freely. We highly recommend it for farms that collects manure every few weeks or months.
