Custom Automated Solutions and Revolutionary Machinery

Amarillo, TX – Increase productivity and safety by automating your processes. Midwest Machine, LLC designs and manufactures custom and proprietary systems to solve processing problems in the meat industry. The Patented Smart Rib Saw will be on display along with the introduction of the newly developed Proportioning Saw.

The fully automated Smart Rib Saw, primarily designed for the beef industry, is a revolutionary new way to remove the chine from the rib. Using the latest in 3D scanning technology, the Smart Rib Saw uses a proprietary algorithm to optimize the cut path, removing the chine while increasing overall product yield. The only labor required is an operator to load product on the conveyor.

The Proportioning Saw (Patent Pending) was developed to rapidly cut product to a pre-defined thickness. Applications include steaks, chops, pressed meat, etc. This machine is capable of cutting 30" long pieces at rates of 20 cuts per minute, with a single operator capable of feeding two machines simultaneously.

For demonstrations and information about Midwest Machine's other cost-saving systems, or if you have a process that you would like to improve or automate, stop by Booth C1204 at IPPE 2018 to discuss with the industry's leading developers and innovators in automation.
