

CERTIFICATION IS COMPLEMENTARY TO REGENERATIVE SYSTEMS

While our focus remains on the welfare of farm animals, Certified Humane® certification is complementary to regenerative systems, including Regenerative Organic Certified, 'Certified Regenerative' Beef by Greenham, and other individual programs. <https://certifiedhumane.org/regenerative/>

AGRICULTURE COMBATTING CLIMATE CHANGE

Regenerative agricultural practices actively improve the environment and soil carbon sequestration and are a key tool for the future of agriculture in combatting climate change. Intentionally incorporating animals into a pasture system can enrich the soils, promote plant growth, and increase carbon sequestration bringing damaged pasture back to life. Responsible grazing management, part of the Certified Humane® program requirements, will not damage or deplete natural resources and the environment.

The Certified Humane® program verifies farm animal welfare practices that are a critical piece of a complete regenerative agriculture system. Certified Humane® standards ensure these animals are not overcrowded and they are offered the right grasses for their species and the region. Grazing habits are managed by rotating animals around a pasture to verdant areas with plant life at the right stage of their growth cycle for grazing and maximum nutrient benefit. This is known as Rotational Grazing and done correctly, it will nourish the animals and stimulate long term pasture growth, naturally holding carbon in the soil.
