

DACS to showcase new Anti-Reverse fan at IPPE

DACS have developed a new Anti-Reverse fan impeller hub, sold as an add-on to their MagFans.

The system adds a new level of safety to systems operating in areas affected by phase loss or power glitches.

In the event of loss of power to one or more fans, the fans affected will simply lock the impeller and prevent reverse spinning, even if shutters fail to close.

Operated by gravity and centrifugal forces, the system is 100% loss free and has been tested at Bess Lab.
