Production lines for the food processing industry
fully automatic – highly flexible – customized

The growing demand for culinary specialties and delicacies is served by the food industry with more and more exceptional products in premium quality. New technologies are required by mechanical engineers to make these creative and innovative products. A reliable, efficient machine fleet, customized to the individual needs and individual capabilities, is the most important thing for the success.

We face this challenge.

For us as a global operating medium-sized mechanical engineering company, IPPE is one of the most important trade fairs. The professional trade audience has a strong interest in intelligent technology solutions.

In this context, KARL SCHNELL is well positioned with its broad product portfolio and can give producers any support in optimizing existing and new product launches.
Numerous new developments in the field of process technology and automation of processes meet the exact requirements of the customer.

KARL SCHNELL was founded in 1948 and has been for more than 70 years a successful partner of the food industry. As a family-owned company we develop, construct and build the process plants and individual machines used worldwide in our own production facilities in Germany. The extraordinary depth of vertical integration provides the optimum basis for customer-specific solutions of the highest standard.

Working in partnership with our customers in conjunction with technical innovation is therefore the primary goal at KARL SCHNELL.
