

**Launches Amino
at IPPE 2022**

MTech Systems Launches Amino- A Beyond Data Management Tool

Amino combines 30 years of industry experience leveraging the latest technologies to bring innovation to any size company or producer.

This solution is a cloud-based full supply chain management analytics software that poultry and swine producers can use to grow their business.

With Amino companies can become more efficient and productive and gather the right understanding to make better decisions. It's one system that's not just for data management but is also a powerful place to gather business insights.

The software is easy to use, and its colorful dashboards make it easy to spot problems and prioritize optimization opportunities.

This end-to-end platform also integrates with tools and devices from [IoT, to planning systems and more](#). The system serves every part of the supply chain from day-old chick to finished product.

Because it ties together costing and performance data in one place it's easier to see what's costing companies the most. The software can also connect offline and offers a mobile app. Producers can look to Amino as a bridge to help them start and continue their digital transformation journeys.

With the recent industry challenges, producers need a way to leverage data for better and insight faster. What is unique about this system is the fact that it centralizes not just financial and performance data, but it also includes a planning system allowing producers to plan and execute in the same system.

“The concept of Amino was born out of a desire to help small to medium producers capture the same level of control and insight through their data that the largest integrators worldwide have enjoyed for years.

We realized early in the process that Amino has so much more to offer the entire food production industry.

The simplicity and elegant way in which it incorporates innovations like Machine Learning is a game-changer for [accurately predicting performance, improving efficiency, measuring carbon footprint, and achieving a more sustainable way of producing food for the growing world population.](#)”

| Said Marcel Cohen, President of MTech Systems

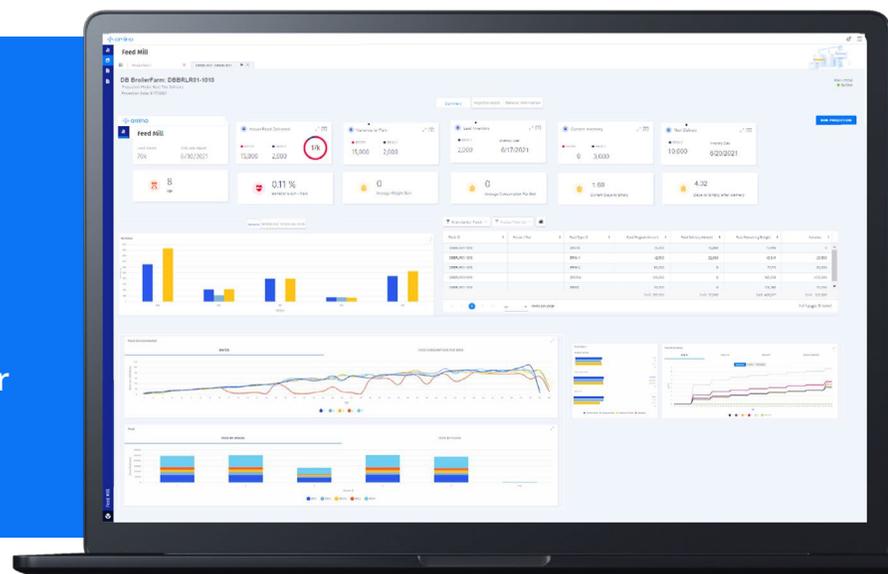

Amino’s development team is comprised of many former industry leaders that came from large poultry companies all over the globe.

Unlike some software, the system was not developed in a box but instead was created by people who lived and breathed industry challenges driving them to the point of coming up with optimal solutions.

Amino’s future development is rapid and will provide producers with a Swiss army knife approach to plan and optimize their production for the best results. In the coming months, Amino will add Business Intelligence capability as well as tools to help producers improve sustainability, welfare, and much more.

Come see us at booth number #b6039
at IPPE to see this technology and all our
developments in action

About MTech Systems

MTech, headquartered in Atlanta, Georgia US, **is the world leader in software systems providing insight and intelligence** to every aspect of poultry and swine production management.

MTech's applications can be found running swine and poultry businesses on six continents in over twenty countries, equipping the customers with the power to utilize comprehensive data in a proactive approach.

Through the software, each segment of production is analyzed to maximize profitability.
